

Classic model applied to category learning

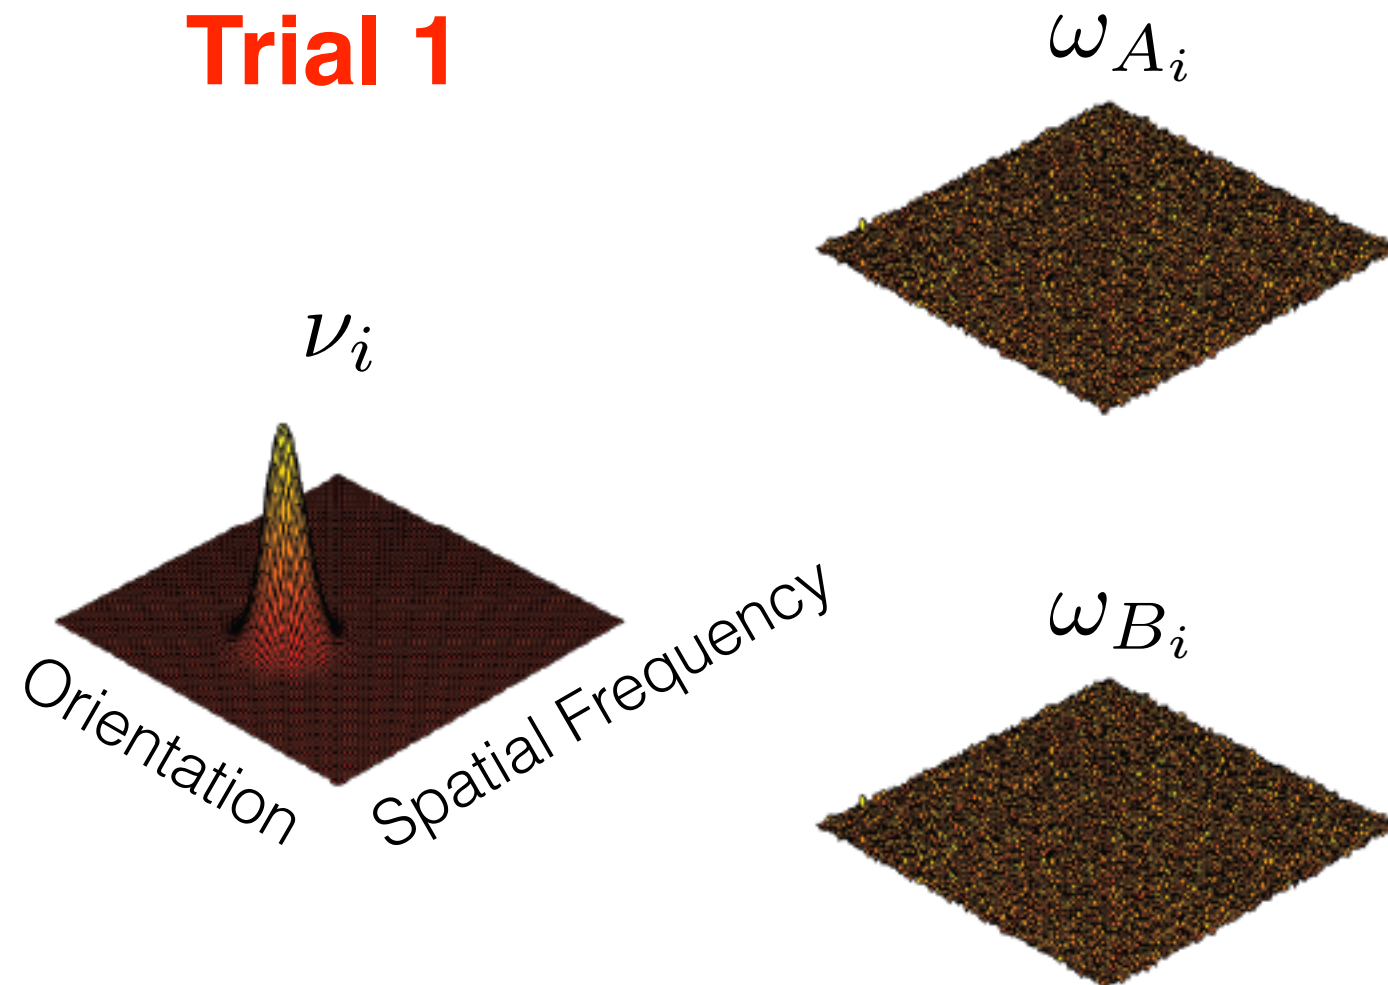

**Stimulus-Response associations learned
through trial-and-error**

Classic model applied to category learning

Trial 1

A Activation

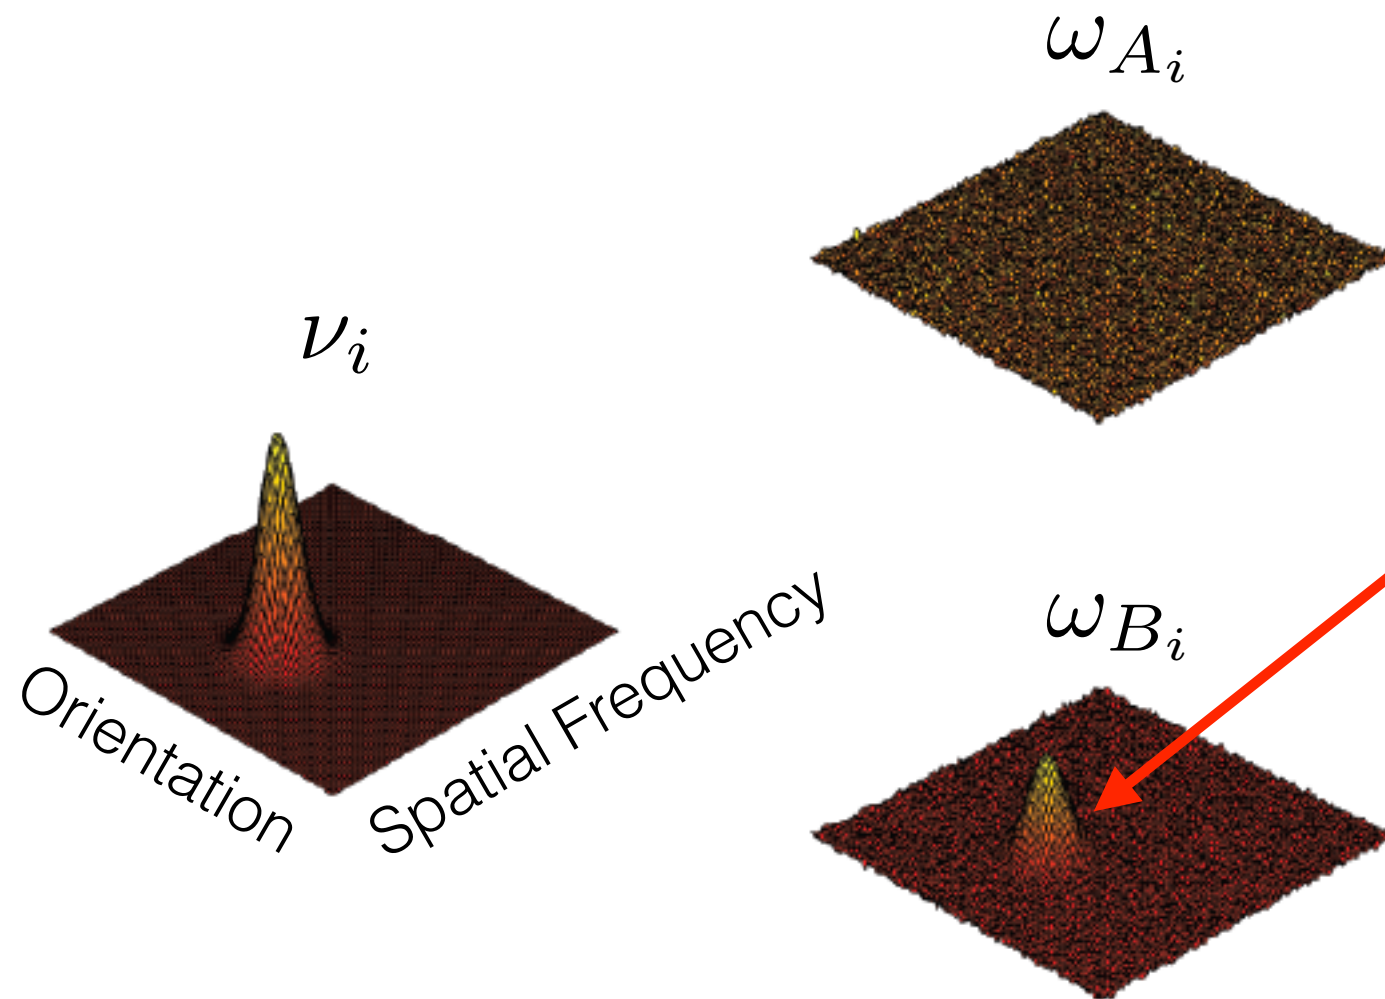

$$\sum_i \nu_i * \omega_{A_i}$$

B Activation

$$\sum_i \nu_i * \omega_{B_i}$$

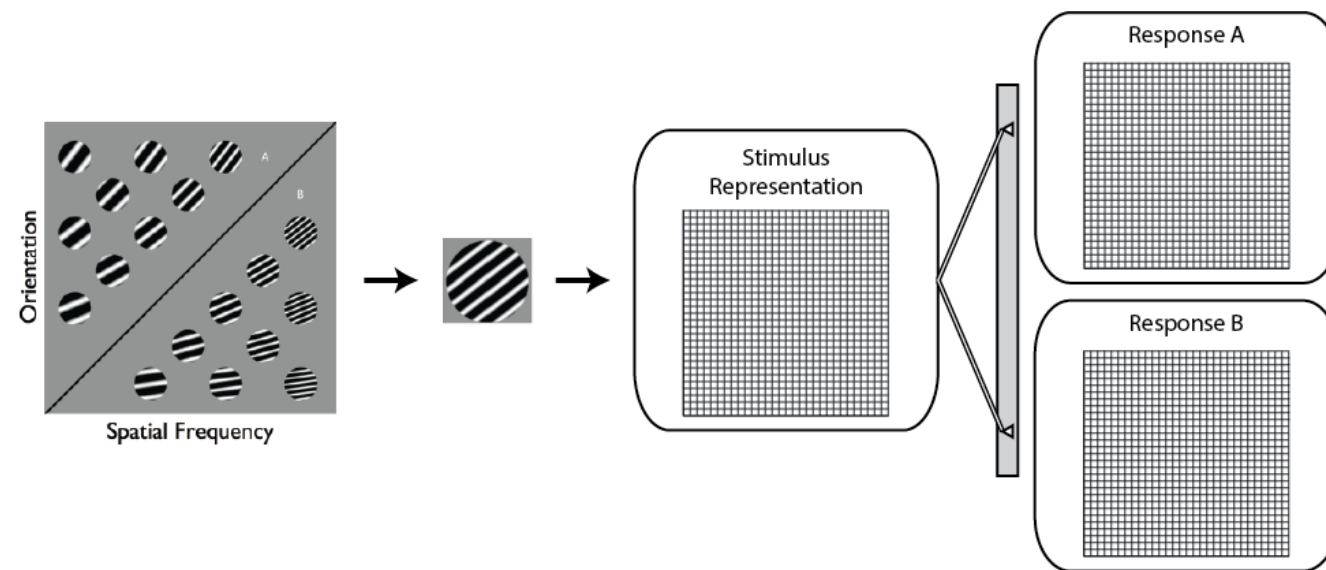

Model correctly guesses B

$$\sum_i \nu_i * \omega_{A_i} < \sum_i \nu_i * \omega_{B_i}$$

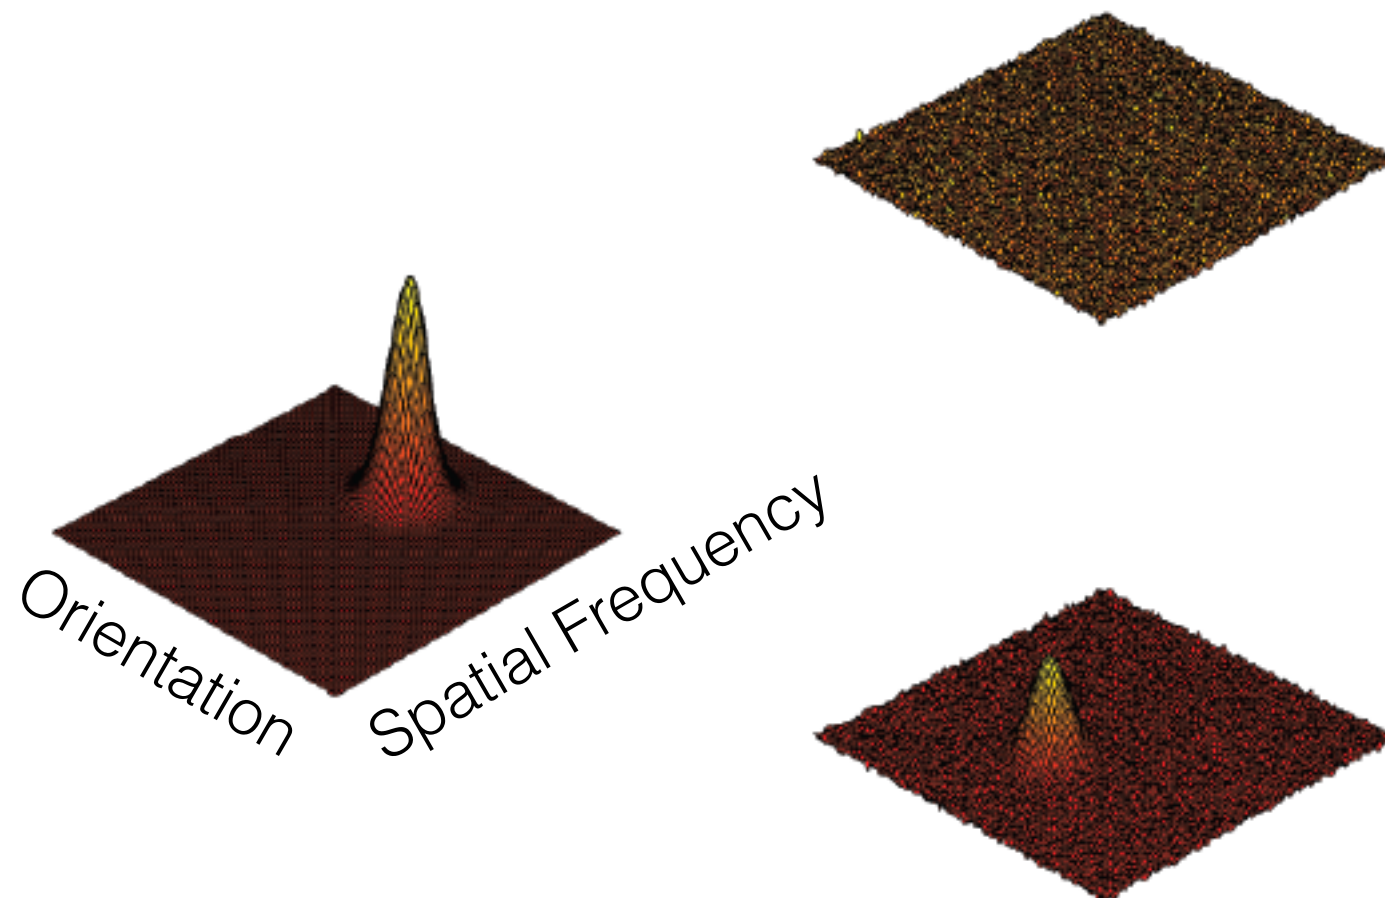

**Unexpected positive
feedback strengthens
active weights**

Learning carries over to trial 2

Trial 2

A Activation

$$\sum_i \nu_i * \omega_{A_i}$$

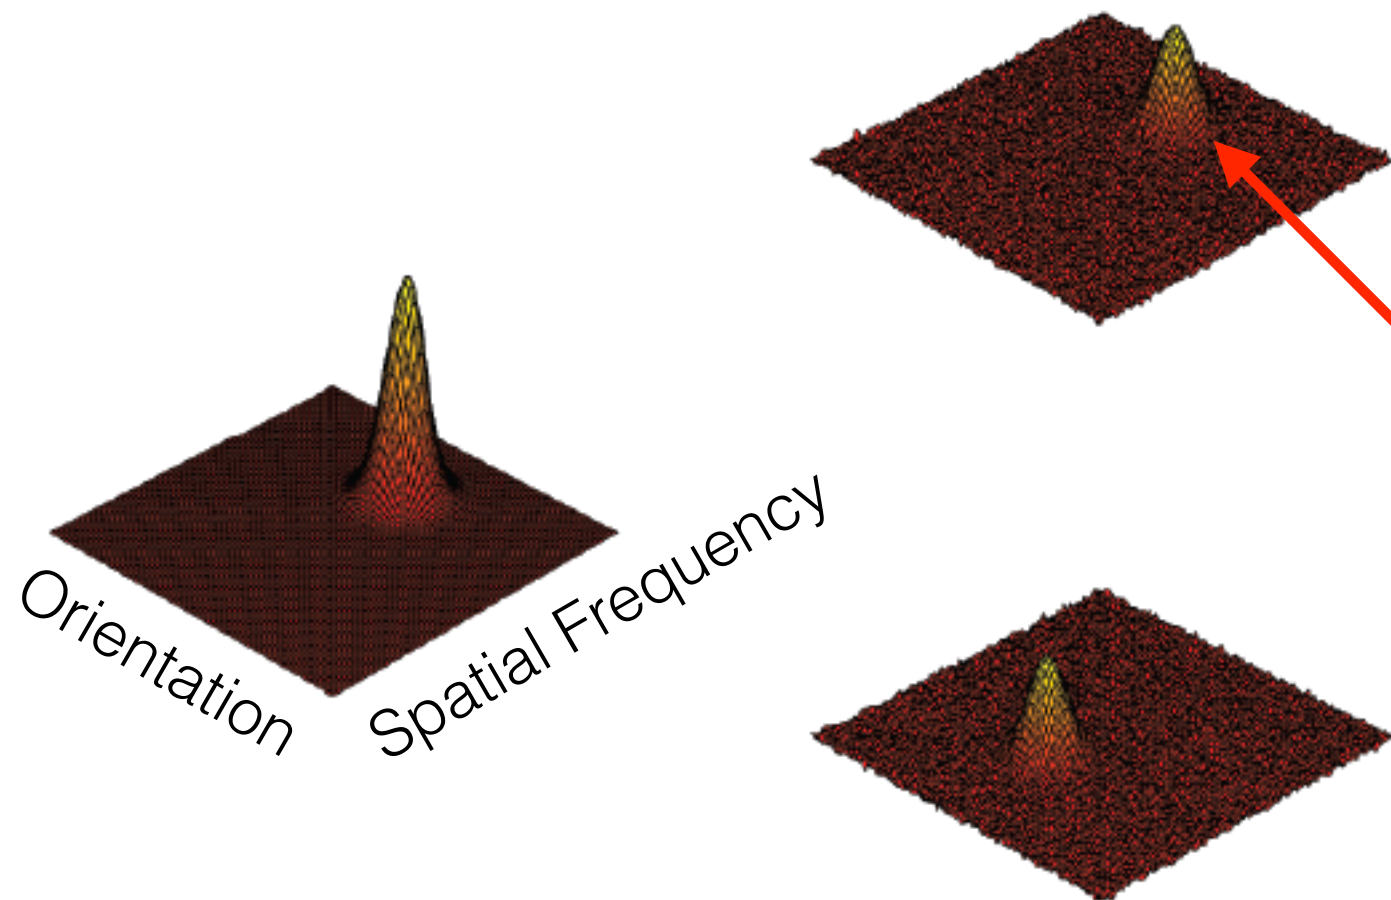

B Activation

$$\sum_i \nu_i * \omega_{B_i}$$

Model correctly guesses A

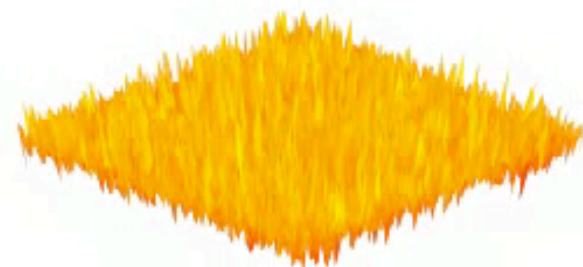

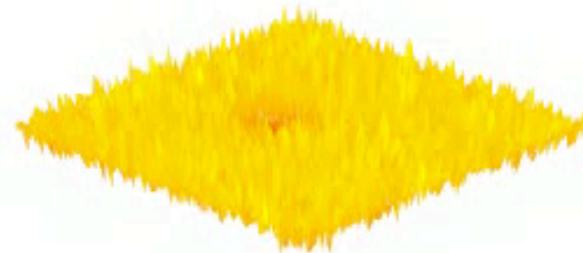

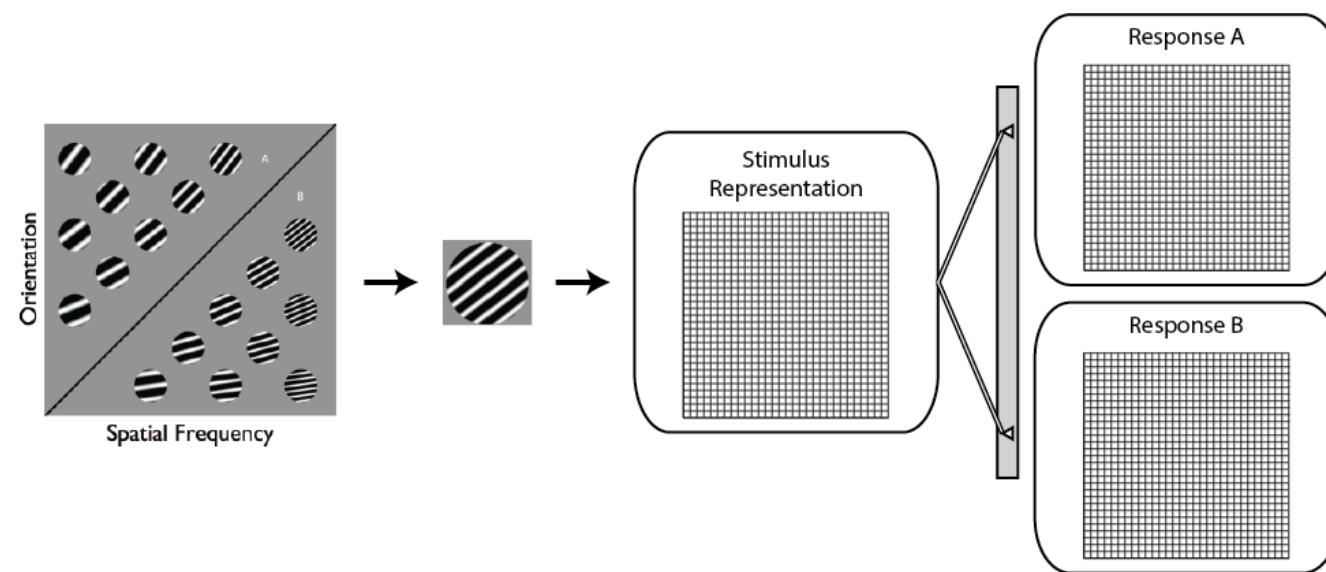

$$\sum_i \nu_i * \omega_{A_i} > \sum_i \nu_i * \omega_{B_i}$$

Trial 2

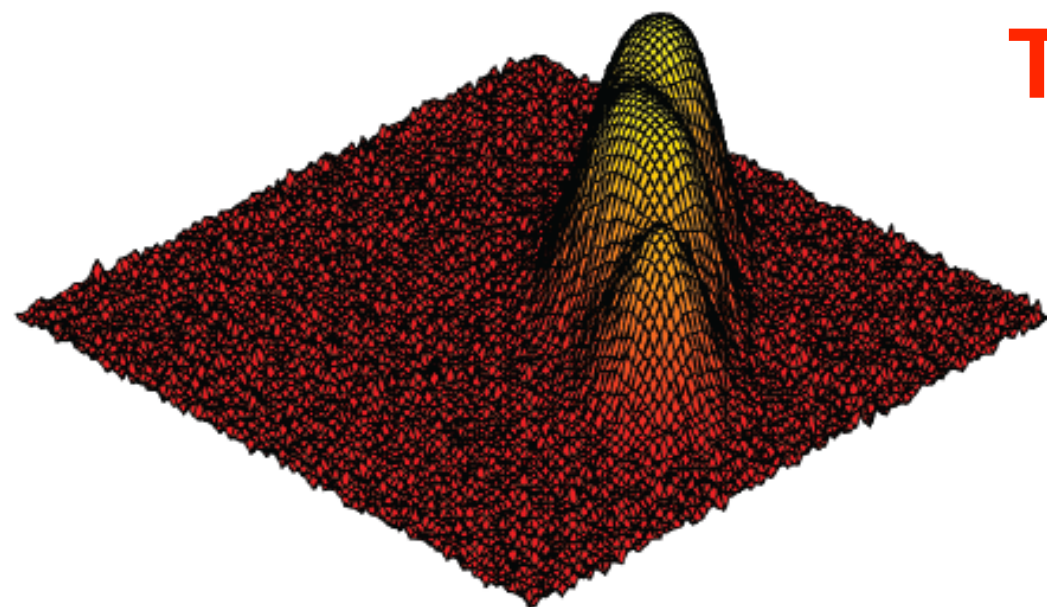

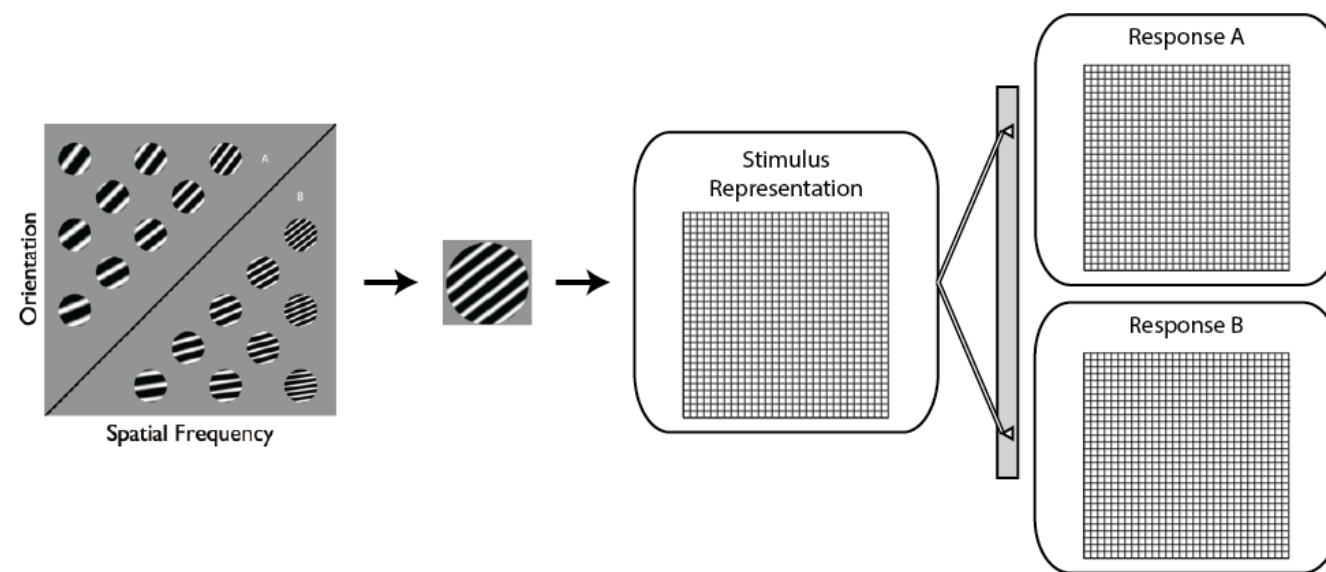

**Unexpected positive
feedback strengthens
active weights**

Classic model applied to category learning

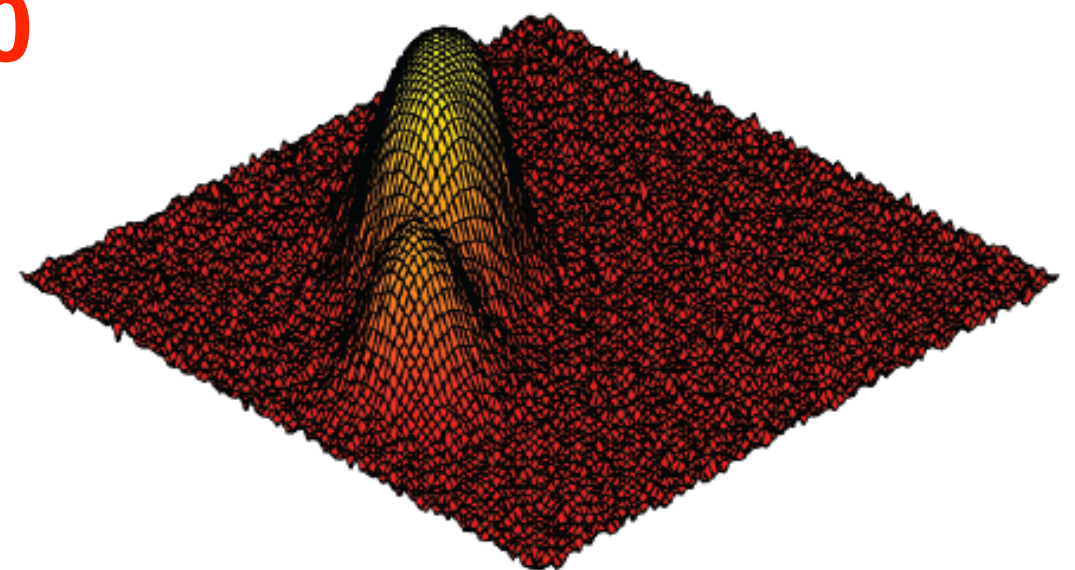

Classic model applied to category learning

A Weights

Trial 300

B Weights
